

## ME-1670 – Team Project Review 2: Part Modeling Status

### Team Information

TEAM Number (see the XL sheet): 13

Title of the Project: Toolio

### Team Member Progress Table

| Team Member's Name | 3D Sketches & Multiviews Done? | Number of Parts Being Modeled | Number of Complex Parts | Planning to Model Additional Parts? | Attending All Team Meetings? | Part Profiles Fully Constrained? | Status& Plan for SubAssembly               |
|--------------------|--------------------------------|-------------------------------|-------------------------|-------------------------------------|------------------------------|----------------------------------|--------------------------------------------|
| Naitik Mundra      | Yes                            | 12                            | 10                      | Yes                                 | Yes                          | Yes                              | Components work together in a SubAssembly. |
| Daniel Velazquez   | Yes                            | 11                            | 6                       | Yes                                 | Yes                          | Yes                              | Components work together in a SubAssembly. |
| Calvin Arnold      | Yes                            | 10                            | 4                       | Yes                                 | Yes                          | Yes                              | Components work together in a SubAssembly. |

### Brief Reflection:

Our experience with the mentor has been very positive and has helped guide us in the correct direction for this project. Many of our initial designs overlooked smaller, critical features present in a part, allowing us to fix these small aspects. Alongside this, the mentor provided incredibly helpful advice for CADing certain more complex parts, allowing us to create these parts more efficiently. The mentor also helped us understand more clearly how some functional mechanisms work together. These things that may not have been taught to us are critical in the engineering design process. The access to the previous project reports allowed us to revise our design in several smaller ways. While the approaches the other projects took to address this problem were significantly different than ours, we could implement several aspects like the pulley system. Some other design changes we plan to implement are making the conveyor easier to design and functional, and making the stem connect to the sorting system more flawlessly. Overall, the experience has been positive and helped us develop our design skills.

Part Models: Naitik Mundra

Part Models: Daniel Velazquez

Part Models: Calvin Arnold
